

# Product Configurator

Piece No	Component	Specification	Qty/ Piece	Qty/ Lot	Type
	17" MONITOR		1.0000	0.0000	Material
	32X CD-ROM		1.0000	0.0000	Material
	4.3 GB DISK		1.0000	0.0000	Material
	450 MHZ		1.0000	0.0000	Material
	64MB RAM		1.0000	0.0000	Material

***The Product Configurator module provides the capability to create multiple configurations of end-items in a more efficient abbreviated manner.***

- Uses configuration workbench to enter, define, and maintain end-item configurations.
- Reduces item, bill of material, and routing database space requirements.
- Simplifies the defining of complex configurations for end items.
- Provides a replacement capability of component items, which allows an item to be replaced in the bill of materials with a specific item as the work order is generated.
- User defines/controls the sequence and interdependencies of module options.
- Saves time by eliminating need for engineering to setup custom BOM for each order line item.
- Features a Catalog Configuration Report that catalog, feature, option, and module information in various levels of detail. The report can be generated for a specific catalog number, a range of catalog numbers, or for all catalog numbers, with summary or detail information.
- Displays a "picking list" of possible features and options when placing an order for base part with features.
- On-line display of options selected for a given order line item.
- Fully integrated with other RRM modules.
